

Tank-O3 *fresh water system*,
previous and new application

The unique Tank-O3 fresh water system has received a simple but highly effective update since early 2025. The system now comes standard with a anti-limescale kit, eliminating limescale buildup.

The kit is also available separately; see our website www.tank-o3.nl, item no. CWR 1720 057. Refill kit, pot + 3 flat sealing rings

Why this update:

As we know, drinking water always contains limescale, sometimes a little less, some a little more. Especially in Southern European countries, water is very limescale-rich.

Because you never know how much limescale is in the water, maintenance is difficult to predict, takes a lot of time, and is sometimes overdue, with all the ensuing consequences.

By adding the supplement kit to the Tank-O3 fresh water system, ozone production is decoupled from the water in the tank. The container, filled with limescale-free water*, is placed around the electrolysis unit, so it no longer comes into contact with limescale-rich water.

**By limescale-free water, we mean demineralized or distilled water.*

The ozone is released into the water through a small hole in the lid of the container. This keeps the water safe and the tank always 100% clean!

Minimal maintenance:

Every 2 to 3 weeks, check if there's enough water in the container. If necessary, top it up or replace the limescale-free water. This eliminates the need for descaling in the cell core; your system is always ready to use!
